

Concept posters

Audience: 7+, although designed with a young audience in mind. The posters have been designed for use as background at events or for using with school groups.

Introduction:

The underlying idea behind these discussion posters is to encourage the audience to think about their pre-conceived ideas about stem cells. Having the questions displayed validates these basic questions the audience may have, helping them see that they aren't 'silly questions', and encouraging dialogue with the scientists. The answers in the bubbles help the audience reflect on what they think. Another way of using the posters is to use them as an introduction to stem cells with groups of school children. Each child could be given 3 small stickers and be asked to place them next to the answers they feel best reflect what they think. The task involves everyone, is anonymous and can lead to discussion about the answers.
