

Cell Turnover

Audience: 7+

Introduction:

Cell Turnover is a computer interactive developed in partnership with the *Centre for The Cell* in London (<http://www.centreofthecell.org/>). It introduces the audience to the concept of cells dying and regenerating and the role of stem cells in this process. The flash file containing the interactive is on the data stick in multiple languages and is self explanatory once opened.

Instructions:

The interactive can be used by the audience on a laptop or PC. It can be run without a demonstrator but we've found that audiences often want to share their amazement at the number of cells they produce and want to ask questions, so it's useful to have someone nearby to answer these.
